

Common misunderstandings & demythologization of blockchain

Promises, terminology, perception & reality

Anatoly Ressin

CEO & Blockchain Architect at Blockvis
Board Member of Latvian Blockchain Association

Intuition & Promises of Blockchain

Clever cryptography-based technology that **by itself** allows

mutually **mistrusting** entities to perform transactions **without relying** on a central trusted third party while offering a **transparent** and **integrity** protected data storage.

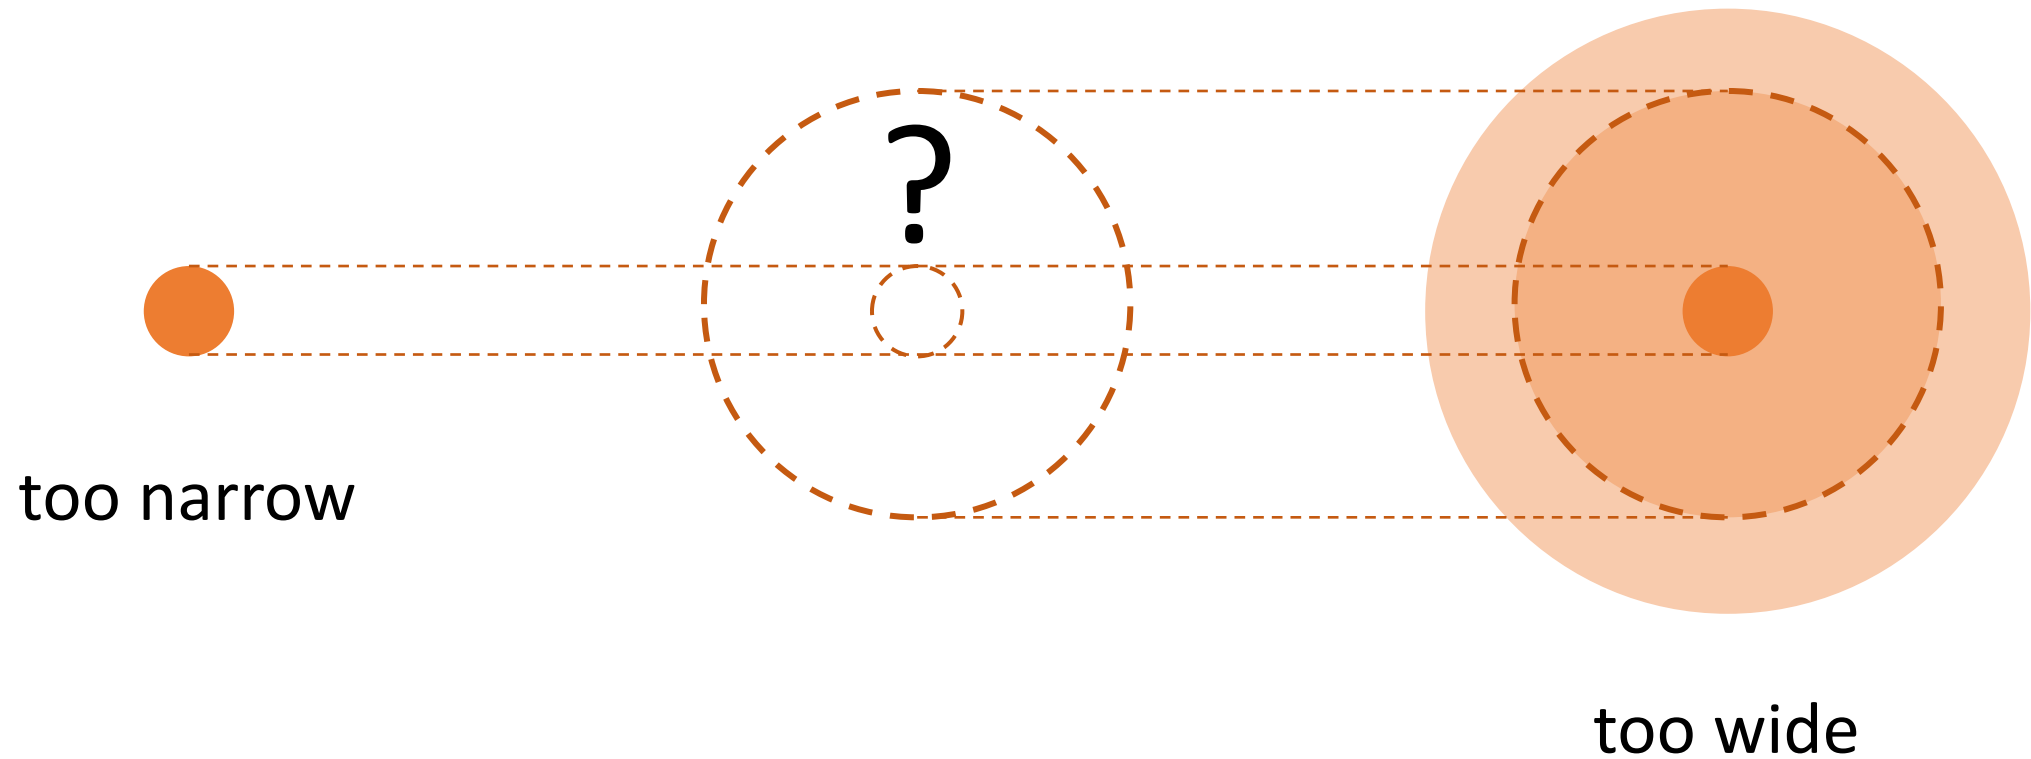

Where is the myth, and where is the truth?

Blockchain

vs.

DLT

Distributed ledger technology

How historical data is stored, grouped and linked together

Chain

As well, grouping transactions into blocks is not necessary - it is one of possible implementations.

Graph

is more general
data structure

Classifying systems by link structure between machines

In both cases elements are connected!

Distributed

vs.

Decentralized

Geographical location

Think Google, or Amazon

Decision making

Only this property eliminates
Centralized Trusted Third Party

Due to mass adoption by non-tech audience..

The word
“Distributed”
is often used
when the word
“Decentralized”
should be used
when addressing
mistrusting problems

“Blockchain” – **umbrella
term**

Ok...

Distributed

vs.

Decentralized

Made for speed
and cost-saving

Made for negotiations
and safe consensus

Extra cost, degraded speed

More than decentralization and cryptography

Balance of interests

At least: Intuition on incentives

At most: Profound Game Theory

External incentive:
value, goods, services

Perfect match for crypto-currencies

A hand with a white question mark on the index finger is pointing towards a wooden balance scale. The scale is tilted, with the right side being lower and holding three stacks of gold coins of increasing height from left to right. The background is a blurred office setting with people in white shirts.

?

Private
"Blockchains"

Equilibrium

in fintech

At least burn an asset to prevent a spam

Only if Carefully balanced!

This technology **combining cryptography with external incentivization** will allow

mutually **mistrusting** entities to perform transactions **without relying** on a central trusted third party while offering a **transparent** and **integrity** protected data storage.

Thank you for attention!
